To the Chairman and Memhers

OF

The Blackwell Rural District Council.

GENTLEMEN,

I have pleasure in submitting for your consideration my Annual Report on the General Sanitary Conditions of your District for the year ending December 31st, 1915, this being the twenty-fourth such report which I have had the honour of preparing since I have acted as your Medical Officer of Health.

Unfortunately, owing to the war, many matters have had to be left in abeyance during the year through financial circumstances. Still, on the whole, a great deal of useful work has been accomplished, and matters needing urgent consideration have in every instance been dealt with.

It was my intention to have introduced a map showing the contributory parishes of the district, but owing to the cost of printing I have decided to allow that innovation, with several others, to stand over until a more opportune time.

I am, Gentlemen,

Yours obediently,

JOHN O. LITTLEWOOD.

General Vital Statistics of the District.

AREA AND POPULATION.

The District has an area of 21,239 acres, and in normal times a population of 1.8 per acre.

	Census.	Census.	End of year
	1901.	1911.	1915.*
Population	. 28,735	39,306	39,540
Inhabited Houses	. 5,514	7,570	8,019

^{*} As estimated by Registrar-General.

Owing to the fact that we are still at war, and have been since August, 1914, it is impossible to do more than make an approximate estimation of the population for the year under consideration.

The Hospitals of Nottingham, Sheffield, Chesterfield, Worksop, and Mansfield are available for medical and surgical cases.

The Rateable Value was £70,052.

The Assessable Value is £131,149.

The General District Rate in the £ was 1s. 03d.

Births and Birth-Rate.

The births registered in the District during the year numbered 1,262, but the number actually belonging to the District was 1,270, as compared with 1,343 for 1914; and they were equal to an annual rate of 32.1 per 1,000 of population. The rate for rural England and Wales was 20.7, and for England and Wales as a whole 21.9 per 1,000 of population.

The birth-rate for the year was only 0.6 per 1,000 below that of the preceding year. The rate must be regarded as very satisfactory, as the country was engaged in war during the whole of the year.

Deaths and Death-Rate.

The nett number of deaths belonging to the District was 478, as against 550 for 1914.

The death-rate for the entire District was 12.1 per 1,000 of population, as compared with 13.4 for 1914.

The rate for rural England and Wales was 13.6.

Infantile Mortality.

During the year 1915, 130 deaths took place under one year of age, which represents a percentage of 27.6 of deaths at all ages in the District.

The infant death-rate for the year was 102.3, as against 115.4 for 1914 per 1,000 births. As the rate of mortality of infants is based on the number of children born in the District, it is

not easy to see how the war could have influenced this exceptionally low rate, beyond the assumption that the mothers had more money at their disposal and more time to devote to the care of their offspring.

It is a well-ascertained fact that many women are better off financially since the war began than ever they were before.

In my report for last year it was shewn that the death-rate for many years past has been gradually declining. The average annual infant death-rate for the five years, 1899—1903, was 168.9. Comparing that figure with the present rate of mortality, 102.3, the general death-rate would be reduced 2.2 per 1,000 of population.

The consideration of these facts has brought home to all public authorities the importance of introducing legislation for child welfare.

Zymotic Diseases and Rates of Mortality.

The zymotic death-rate is subject to great fluctuation according to the epidemic prevalence of one or other of the seven diseases included in this group. The rate appears to be of little real value, as during the epidemics of Measles, Whooping Cough, and Influenza, the number of deaths ascribed to bronchitis and pneumonia is found to be excessive, and ought really to be ascribed to those particular diseases and not as primary affections.

The zymotic death-rate for the year was 2.2 per 1,000 of population, as against 2.3 for the year previous.

The notifiable infectious diseases numbered 421 during the year, and were distributed over the various parishes of the District, as shown on Table II.

Table showing the Number of Cases Notified and Deaths from the Principal Zymotic Diseases for the Year 1915, and ten preceding years.

^{*} The lowest recorded for the last 15 years.

Scarlet Fever.

The cases notified during the year numbered 222, and affected 164 houses. Of the total, 211 occurred in children under 15 years of age.

The brunt of the disease fell on Shirebrook, which had 130 cases.

With the exception of Pinxton, practically all the other parishes in the district were involved. One hundred and sixty cases were removed to one of the isolation hospitals, and there were 10 return cases.

The case-rate per 1,000 of population was ... 5.6

The case mortality per cent. was ... 1.3

The death-rate per 1,000 of population was ... 0.075

Judging from the case mortality per cent. the cases must have been very mild in character, but, unfortunately, that is not always a criterion that the after effects are equally negligible.

Diphtheria.

For some unknown reason this disease has been exceptionally prevalent in the District for some years past.

The notified cases for the year numbered 80, with a mortality of 10, which cannot be considered otherwise than high.

The following are the statistical returns for the preceding year:—

Year.	Cases.	Deaths	Case Mortality per cent.	Death rate per 1000 of Population.	Case rate per 1000 of Population.
1915	80	10	12.5	.25	2.0
1914	111	4	3.6	.10	2.7
1913	43	6	13.7	.14	1.06
1912	72	3	4.0	.07	1.87

Of the contributory parishes of the District, Pleasley appears to have been the one most seriously involved, with a total of 30 cases. Tibshelf had 19, and Shirebrook 18 cases.

For some inexplicable reason, the disease has been endemic in Pleasley and the locality for several years past. Every effort has been made to elucidate the cause without so far the slightest success. At New Houghton, where the incidence was the highest, the area is well drained, and the scavenging systematically carried out by the Colliery Co.

Regarding the three parishes particularly involved, the following are the statistics shown:—

	Сазев.	Deaths.	Case Mortality per cent.	Death-rate per 1000 Population.	Case rate per 1000 Population
Pleasley	30	3	10	1.2	12.8
Tibshelf	19	3	15.8	.76	4.8
Shirebrook	18	1	5.5	.09	1.7

On reviewing the above data it is evident that whilst Pleasley suffered the worst as regards prevalence, Tibshelf paid the highest death toll.

Diphtheria antitoxin was liberally supplied free of cost to all the parishes of the District, and a fee of 2s. 6d. paid to the medical attendants for injecting.

Small Pox.

The District has again experienced immunity from this disease.

Measles.

This disease was responsible for 32 deaths during the year, 31 taking place in children under 5 years of age. The parishes chiefly affected were Pinxton, Shirebrook, and Ault Hucknall.

The mortality arising from measles amongst the working classes is so severe as to cause the Local Government Board to consider the advisability of making the disease compulsorily notifiable.

Unless this is followed up by a nursing scheme such compulsion will prove more or less a failure. The disease in itself is not serious, and seldom leads to fatal results, the danger lying in not fully realising the after effects, such as bronchitis, pneumonia, and tubercular susceptibility.

Whooping Cough.

Six deaths occurred from this disease, all in children under two years of age.

Whooping Cough acts similarly to Measles in its after effects, and requires much more attention that is generally believed.

In all probability, before many more years have passed, these diseases, like Typhoid and Diphtheria, will be satisfactorily treated by vaccines.

Phthisis and Other Forms of Tuberculosis.

It will be observed that the death-rate from consumption was slightly below that of 1914.

Reviewing the statistics generally, and comparing them with the returns for 1914, they are certainly on the favourable side, although they are still slightly above the average for the country. This is not to be wondered at, seeing that urban conditions prevail to a marked extent in the Blackwell Rural area.

There are at the present time something like 141 persons suffering from Tuberculosis of the Lungs (Phthisis) in the district, who are periodically visited by the Nurses.

As Tuberculosis is a discase which may attack practically any organ of the body, leading to many years of suffering and incapacity for work, the State is fully justified in devoting money and attention in combating so widespread an evil.

Judging from the diminution in the death-rate from Tuberculosis of the Lungs, which has gradually been falling for many years

past, there is every reason to believe that by putting into operation certain rules and regulations, which have been found by experience to be beneficial, the rate may yet be very considerably further reduced.

One of the interesting things which this war is teaching young people is the beneficial influence which an outdoor life has upon the constitution, and in this respect alone it will have accomplished a useful object.

The day may come when it will be deemed advisable to compulsorily segregate every case of consumption in the infective state. The erection of sanatoria throughout the country aims at this object, but whilst an infective case is allowed to leave, the object is to a great extent defeated.

After the disease has been arrested a much greater degree of segregation is advisable than is now carried out. Certain occupations favour the development of Tuberculosis in every form, and for a person to engage in any such employment, particularly after this disease has been arrested by outdoor treatment, is simply to invite trouble.

The three Tuberculosis Nurses engaged in the District are doing an excellent work by pointing out, not only to the infected person, but to the other inmates of the house, how easily the disease may be spread.

Unfortunately, Phthisis is often only discovered when the disease has progressed to a marked degree. This is not to be wondered at, particularly amongst certain classes of people, as it may be very insidious in its origin, and may be regarded as too trifling to seek medical aid.

The Education Committee of the County Council, by requesting the School Dector to examine periodically the children of parents or near relatives who have suffered from the disease, is taking a wise precaution.

Instructions to Consumptives.

Your three chief wants are Fresh Air, Rest, and Good Food

1. FRESH AIR.—You cannot have too much fresh air, and should try to spend at least eight hours a day out of doors.

When indoors, keep the bed and sitting rooms as nearly like the outside air as possible, by keeping the windows wide open. Never sleep with the windows shut, however cold may be the weather. A draught is much less dangerous than a stuffy room; indeed, some draught or current of air is necessary to good ventilation. Avoid all crowded rooms, such as theatres, concerts, and public meetings.

2. REST.—One great danger to persons with, or recovering from, consumption, is the tendency to take too violent exercise. At first it is best to spend several hours of the day sitting or lying out of doors, well wrapped up in cold weather, and sheltered from the wind. Later on, gentle walks may be taken, and the distance walked gradually increased week by week. If your temperature goes up, you are exerting yourself too much. If it goes above 100 degrees you should spend most of the day resting. If your temperature remains normal and your weight increases, you may gradually increase your exercise.

Running, jumping, and all heavy or dusty work are forbidden. Always rest for an hour before and after meals.

3. TEMPERATURE.—Take your temperature in the mouth three times a day, before breakfast, after dinner, and at bed time, and record it in your diary. Wash the thermometer in cold water immediately after using it, and keep it in a jar of disinfectant.*

- 4. WEIGHT.—Weigh yourself, if possible, once a week, and keep a record of your weights.
- 5. FOOD.—The ordinary full meals of a healthy man should be taken. Eat slowly, and try to finish your meal, even if you do not feel hungry. Drink two or three pints of boiled milk daily, and avoid alcoholic stimulants, unless specially ordered by the doctor.

Milk is a complete food, but there is no real nourishment in wine, spirits, beer, or stout.

PRECAUTIONS AGAINST INFECTION.

Phlegm.—The phlegm contains the Germs of Consumption, and must never be allowed to dry and get into the dust of the house.

When indoors spit into a mug, and when out of doors into a pocket-spittoon. Empty the mug and spittoon into the fire, and rinse well with hot water. Keep a little disinfectant* in the mug and spittoon.

After coughing, the lips may be wiped with pieces of rag, which should be burnt at once, or with a handkerchief kept in a linen bag, and not loose in the pocket, or under the pillow. Used handkerchiefs should be boiled daily, and the bag once a week.

Consumptives must not be kissed on the lips.

.If these precautions are taken, and the room kept airy, light, and clean, there is not much risk of infection. Another person may share such a room, but not the same bed.

Cups, spoons, and other feeding utensils must be kept separate and scalded after using.

^{*} Disinfectant Solution may be made of Izal, 2 teaspoonfuls to a pint of water, or Carbolic Acid, 2 tablespoonfuls to a pint of water.

Summer Diarrhœa.

Diarrhea is a disease common to slum life and to areas wherever insanitary conditions exist. It is estimated by the Registrar-General that something like 39,000 children under two years of age perish annually from this cause, and that 17,000 deaths take place in children under one year old. With such a death-roll there is no wonder that the Local Government Board are considering means for preventing the spread of such a fatal malady.

There appears to be several causes why young children are particularly liable to be attacked. In the first place, the secretion of a child's stomach contains but little acid, which has an antiseptic action on organisms swallowed with food. Secondly it is very rare to find cow's milk germ-proof, and thirdly, the exposure to cold to which so many children are ignorantly or carelessly subjected renders them liable to chill, which is a factor of the greatest possible importance.

Breast-fed children are considerably less prone to Diarrhæa than those who are bottle-fed on cow's milk, unless it is boiled.

In summer time a wise precaution is to substitute dry milk for cow's milk, when artificial feeding has to be resorted to.

During the year 33 deaths took place in children under two years old, 25 occurring in the first year of life.

Infantile Diarrhœa.

1.—CAUSE:—

Contamination of Food by FLIES, DUST, and FILTH generally.

2.—PREVENTION:—

- (a) Every possible means should be employed for the destruction of flies.
- (b) Foods of every description should be carefully protected from Flies, Heat, and Dust, and not allowed to remain unduly long in the living room.
- (c) All Milk should be covered with muslin, kept in a cool place, and scalded before use.
- (d) Kitchen Floors and Tables should be kept clean.
- (e) Do not allow the use of a "Comforter," or a Feeding Bottle with a long tube.
- (f) A child should not be weaned except when in good health.

 Avoid weaning in the months of July, August, and September if possible.

3.—TAKE NOTICE:—

All Animal and Vegetable Refuse should be destroyed by burning.

At the commencement of an attack of Diarrhea it is desirable to withhold the use of milk for at least 48 hours—substituting barley water in its place.

An outbreak of Gastro-enteritis occurred in the parishes of Blackwell and South Normanton about the first week in March, involving some thousands of the inhabitants.

The cause of the outbreak was due to the pollution of the water supply by the sewage of Huthwaite gaining ingress to the mains in that parish. The epidemic was investigated by Dr. Rees, of the Local Government Board, and a report on the results of his inquiry was issued in a printed form.

Typhoid Fever.

Cases notified	•••	8
Deaths	•••	1
Death-rate per 1,000 of population	•••	0.02
Case mortality per cent	• • •	12.5
Case rate per 1,000 of population		0.2
Average case mortality per annum, 10 previous year	rs	9.8

The dates and the distribution of the cases were as follows:-

1st case, March 3rd, male aged 43, Shirebrook.

2nd case, April 3rd, male aged 43, Normanton.

3rd case, April 3rd, male aged 43, Normanton.

4th case, April 14th, male aged 15, Blackwell.

5th case, April 14th, male aged 12, Blackwell (same house).

6th case, July 6th, male aged 6, Ault Hucknall.

7th case, July 21st, male aged 37, Shirebrook.

8th case, October 6th, male aged 40, Shirebrook.

A perusal of the above data shows that nothing approaching an epidemic occurred.

There appears to be no doubt that, with the exception of the two Blackwell boys (who slept together), they were all dissimilar in origin.

Every effort was made to prevent the spread of the disease by prompt isolation and disinfection.

Whenever doubt exists as to diagnosis the medical man in attendance has always the advantage of confirmation by a blood examination, which is undertaken by the Public Health Department of the County Council. Bacteriological examination of water is also undertaken by the same authority.

Chemical analysis of water appears to be of little value unless the water is very highly polluted.

Isolation Hospitals available for the reception of infectious cases are at Langwith. Morton, Marston Moor, and Penmore.

The number of cases removed during the year was 204, at a cost of £464 15s. 0d., averaging £2 5s. 8d. per ease.

Notification of Births Act, 1907.

This Act was adopted early in 1914, and came into operation on May 1st of that year.

It was introduced with the object of conserving child-life, having regard to the fact that a very large proportion of children die before attaining one year of age. There is no doubt that it is only a preliminary step to other measures of greater importance, for unless the visits of the nurse are capable of being followed up by certain remedial measures in cases where the infant is found not to be making the progress it ought, the Act is more or less a dead letter.

But it has been found to be an excellent precursor to the establishment of Infant Welfarc Centres, and no doubt the promoters of the Act had that object in view. Where they have been worked together the results, although somewhat premature, promise to be very satisfactory. At a time like the present it behoves the country to exercise every possible means in its power to save every child born in the land, as before the war is over the country will be depleted of a vast amount of human life.

It is very advisable that a well-trained nurse should, in certain classes of the community, visit a child at least once a month until it has attained the age of one year, for by practice she becomes very ready in detecting minor ailments, due in the majority of cases to improper feeding.

It has been observed that during the first twelve months of life errors in diet often occur, and unless corrected they may allow the child to get in such a condition that it will fall a ready victim to attacks of numerous diseases which, if they do not prove fatal, may produce results which will leave a lasting impression on the future life of the child. The timely advice of a well-trained nurse can do much to set things right, but if in her judgment the case is beyond her skill, she may impress upon the parent the advisability of bringing the infant to a Babies' Welcome, where it will receive the attention of a doctor.

Since the Act came into operation in the District 711 primary visits have been paid, and no less than 1,018 subsequent visits. This is bound to have a beneficial influence, but when it is supplemented by the establishment of Centres, open at fixed times for the reception of all children, whether actually ailing or not, it must add considerably to the well-being of the infant life of the District.

The Establishment of Infant Welfare Centres.

The Council, after careful consideration for some time, finally resolved to establish Infant Welfare Centres and Mothers' Welcomes throughout the District. An agreement was arrived at to engage an extra nurse, and to appoint the Medical Officer of Health to superintend the work and attend at the Centres for the purpose of giving advice to mothers on the management and treatment of their children.

The necessary consent of the Local Government Board was readily obtained, and an early start was made in 1916.

There are, and have been, in existence for some time past, Babies' Welcomes in the large centres of industry in different parts of the country, but I am not aware of many yet established in rural districts on the lines it is proposed to work the Centres in the Blackwell area.

Before inaugurating the scheme it was deemed advisable to seek experience already gained at several of the best regulated Centres in the country, and visits were paid for that purpose.

There is every reason to believe that the members of the Council, by adopting such a progressive and spirited policy, will witness in the near future results fully justifying the action they have taken.

Report of School Medical Officer.

The chief feature of outstanding importance in connection with the medical examination of school children for 1915 is the inclusion of an intermediate group, viz., those between the ages of eight and nine years. This has brought in quite a large number of children at an age when a medical examination may prove of immense value, as they can be kept under observation for four or five years before being finally liberated into the world as more or less free agents.

It is estimated that for every million of children attending school, something like 350,000 are incdically examined annually, and of that number there are approximately 130,000 found to be suffering from some disease or defect. Of this total about 70,000 receive treatment.

The Education Authorities deal annually with 1,900,000 children, of whom 375,000 receive treatment.

Unfortunately there are many parents who absolutely disregard the warnings given them with regard to their children's welfare; in some cases it is through prejudice, but in the majority it is just indolence. The head teacher is capable of accomplishing much good for the children under his care, but it depends absolutely on the personal interest he takes in the scholars. I know of one teacher who succeeds in practically securing every defect attended to, and is sufficiently persistent to get over 90 per cent. of the complaints remedied.

Education Authorities are now empowered, through certain Acts of Parliament, to make provision for the education of physically defective, mentally defective, and epileptic children, and also for such as are deaf and blind.

Had it not been for the war in all probability increased facilities for the treatment of diseases of the eye, ear, throat, nose, and skin would by now have been provided.

It is most disheartening to have the same children brought under one's notice time after time by interested teachers, only to find that nothing has been done to remedy comparatively minor ailments.

The nutrition of a child is of the utmost importance, for on it depends the functional activity of both mind and body.

Derbyshire Education Committee's Returns, 1915.

Results of Medical Inspection for the year ending December 31st, 1915, in the Rural Sanitary District of Blackwell, for the following parishes, viz.: Normanton, Blackwell, Tibshelf, and Pinxton:—

Housing and Town Planning.

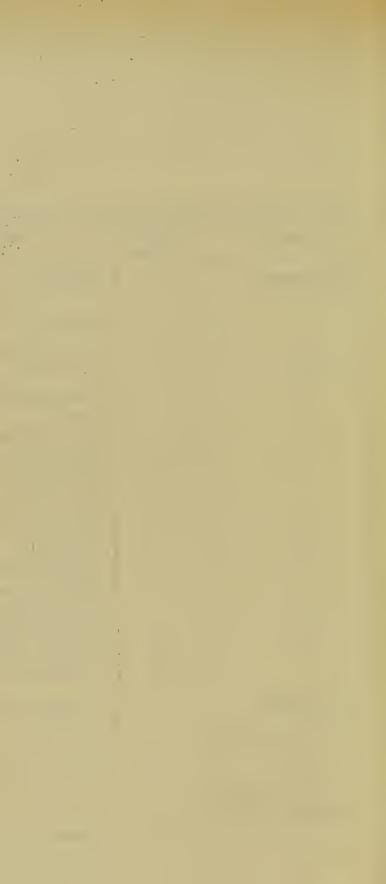

Owing to the war the Council decided to modify the course previously adopted in carrying out the provisions embodied in the Act.

The officers were instructed to deal only with such cases as, in their judgment, obviously appeared to be injurious to health, such, for example, as leaky roofs, defective privy middens, defective drains, and insanitary backyards.

Number of Closing Orders made	9
The number of dwellinghouses, the defects in which were remedied without the making of Closing Orders	460
The number of dwellinghouses which, after the making of Clesing Orders, were put into a fit state for human	
habitation	5

The general character of the defects were usually found to be damp walls, defective roofs, absence of damp course, defective caves spouting, defective and insanitary paving of backyards, defective and insanitary privies and ashpits.

It has been the practice since the Act was adopted to deal with such properties and areas as was thought to be most urgently requiring attention.

A good deal of the overcrowding prevalent during the two previous years has been considerably lessened owing to the number of men who have enlisted, these approximately numbering 2,823.

Owing to the difficulty in obtaining labour the provisions of the Housing and Town Planning Act have had to remain in abeyance. The supervision of all newly erected houses is under the jurisdiction of the Surveyor.

Water Supplies.

There is nothing of importance to add to my remarks for 1914.

Closet Accommodation.

Number of houses converted from privy middens to w.c.'s 16

Number of houses converted from pails to w.c.'s 11

Scavenging.

The cost of scavenging remains the same as stated for 1914. Each year greater difficulty is experienced in providing suitable places for the deposit of house refuse, particularly in Shirebrook. It may be possible to continue for a few years longer before providing some better means of disposing of the refuse.

Disinfection.
